Cryptocurrency Spot New Listing Strategy

1. Participate in the **call auction phase** when a new spot listing opens.
2. Keep sufficient capital available to build your intended position when the market opens.
3. After regular trading begins, use **Fibonacci retracement levels** to identify potential support, resistance, entry, and exit zones.
4. Be aware that new listings are highly volatile and can experience rapid price movements, including gains of **10× within seconds or minutes**.
5. Define the profit target before entering the trade.
6. If the price reaches the target (e.g., **2× or higher**), execute the sell order immediately according to the trading plan rather than relying on further price appreciation.
